

Outcome Monitors: Recovering Silent Tool Failures in LLM Agents

Sugam Author Rabab Abdelfattah

AIMS Lab, University of Southern Mississippi

Abstract

Modern artificial intelligence (AI) systems are powered by foundation models that increasingly act through external tools. When a tool call fails silently, the agent's downstream reasoning proceeds on stale or fabricated state. This paper presents Outcome Monitors, a lightweight observability layer that detects unacknowledged tool failures from the conversation trace alone. This abstract is placeholder text demonstrating the line-header variant on the plain article class.

1 Introduction

Foundation models are general models of language, vision, speech, and/or other modalities. This body text exists only to show the layout continuing below the line header.
