

Outcome Monitors: Recovering Silent Tool Failures in LLM Agents

Sugam Author Rabab Abdelfattah
AIMS Lab, University of Southern Mississippi

Abstract

Modern artificial intelligence (AI) systems are powered by foundation models that increasingly act through external tools. When a tool call fails silently, the agent's downstream reasoning proceeds on stale or fabricated state. This paper presents Outcome Monitors, a lightweight observability layer that detects unacknowledged tool failures from the conversation trace alone. This abstract is placeholder text demonstrating the simple corner-logo variant on the plain article class.

1 Introduction

Foundation models are general models of language, vision, speech, and/or other modalities. This body text exists only to show the standard single-column layout with nothing changed except the corner logo.
